FAQ: Addressing Common Questions About PADI Altitude Diving

Q1: What is the minimum altitude considered "high altitude" for diving purposes?

A1: Generally, altitudes above 3000 feet (914 meters) above sea level are considered high altitude for diving, requiring specialized training and planning as outlined in the PADI Altitude Diver manual. Below this altitude, the effects of reduced pressure are less significant but still should be considered.

Q2: Why is gas management more critical at high altitude?

A2: At higher altitudes, the partial pressure of oxygen is lower. This means that divers consume air more quickly to achieve the same level of exertion. This increased consumption requires more careful planning to ensure sufficient gas supply for the entire dive, including ascent and decompression stops.

Q3: Are there specific decompression tables for altitude diving?

A3: Yes, absolutely. Standard decompression tables are not appropriate for high-altitude diving. The PADI Altitude Diver manual provides detailed information and guidance on using altitude-specific decompression tables which account for the reduced ambient pressure.

Q4: Can I use enriched air nitrox (EANx) at high altitude?

A4: Yes, EANx can be beneficial at altitude, but its use requires careful planning and understanding of the partial pressures of oxygen and nitrogen at altitude. The manual provides guidance on appropriate EANx mixtures for high-altitude dives and the necessary calculations.

Q5: What are the key signs and symptoms of decompression sickness at altitude?

A5: The symptoms of decompression sickness are similar at altitude as at sea level, including joint pain, fatigue, numbness, and dizziness. However, the onset might be quicker at altitude due to the reduced pressure. Immediate ascent and medical attention are crucial if symptoms appear.

Q6: What are the limitations of the PADI Altitude Diver manual?

A6: The manual provides excellent guidance within the PADI framework. However, it's crucial to remember that it doesn't cover every possible scenario. Divers should always exercise sound judgment and prioritize safety. Furthermore, the manual's information pertains specifically to PADI procedures; other training agencies may have different standards.

Q7: Is it possible to dive at very high altitudes (e.g., above 10,000 feet)?

A7: Diving at extremely high altitudes presents significant physiological risks and is generally not recommended without extensive experience and specialized training beyond the scope of a standard PADI Altitude Diver certification. The risks of altitude sickness and severe decompression issues significantly increase at such elevations.

Q8: Where can I get the PADI Altitude Diver manual?

A8: The PADI Altitude Diver manual is typically available through PADI dive centers and instructors who offer the Altitude Diver specialty course. It can also sometimes be purchased online from reputable dive equipment retailers.
