FAQ

Q1: What is the difference between a centrifugal pump and a positive displacement pump?

A1: Centrifugal pumps use centrifugal force to move water; they are commonly found on fire trucks. Positive displacement pumps move a fixed volume of water with each stroke; they're less common on

Ifsta Pumping Apparatus Study Guide

fire apparatus but useful in specific situations (e.g., high-pressure applications).

Q2: How important is proper pump priming?

A2: Proper priming is essential. Without it, the pump will not be able to draw water from a source, rendering it ineffective. The IFSTA guide details various priming methods and troubleshooting techniques for priming difficulties.

Q3: What are the key elements of effective water supply calculations?

A3: Accurate water supply calculations involve determining the required flow rate (GPM), pressure, and distances involved. Understanding friction loss, elevation changes, and the capacity of the
