Frequently Asked Questions (FAQs)

Q1: What is the difference between DIN 43673-1 and other hydraulic fluid standards?

A1: DIN 43673-1 focuses specifically on mineral oil-based hydraulic fluids. Other standards, such as ISO standards, may cover a broader range of hydraulic fluid types, including those based on synthetic fluids or other base stocks. While there can be overlap, the specific requirements and test methods may differ.

Q2: How often should I test my hydraulic fluid for compliance with DIN 43673-1?

A2: The frequency of testing depends on factors like the application, operating conditions, and the fluid's age. Regular testing, typically based on scheduled maintenance intervals, is recommended. This ensures early detection of degradation and allows for timely fluid changes to prevent system failures.

Q3: Can I mix different hydraulic fluids that meet DIN 43673-1?

A3: While it might seem acceptable, mixing different hydraulic fluids, even if both comply with DIN 43673-1, is generally not recommended.
