The F01 Fireguard study guide emphasizes the critical importance of recognizing different fire types. Understanding the nature of the fire dictates the appropriate suppression methods. We commonly categorize fires into four classes:

- **Class A:** These fires involve ordinary combustible materials like wood, paper, cloth, and plastics. They are characterized by glowing embers and readily extinguished by cooling with water.
- **Class B:** These fires involve flammable liquids such as gasoline, oil, and grease. Water is ineffective here; instead, suppression relies on smothering the flames and removing the fuel source.
- **Class C:** These fires involve energized electrical equipment. Never use water on these fires due to the risk of electrocution. Instead, specialized extinguishing agents or power disconnection is necessary.
- **Class D:** These fires involve combustible metals like magnesium, titanium, and sodium. These require specialized extinguishing agents as water can exacerbate the fire.

- **Class K:** These fires involve cooking oils and fats. They require specialized extinguishing agents designed to prevent reignition.
